TWO PHASE TREATMENT

Phase One PHASE ONE IS AN IDEAL FIRST STEP!

Functional Appliances - Ages 5 to 12

Early treatment should be initiated for:

- Habits such as tongue thrusting and thumb sucking
- A constricted airway due to swollen adenoids or tonsils
- Mouth breathing or snoring problems
- A bad bite
- Bone problems (i.e. narrow or underdeveloped jaws)

Phase Two

Braces - Ages 12 to 14

- Teeth are straightened with brace
- Braces usually take about 1½ to 2 years
- Teeth are whitened

EARLY TREATMENT IS KEY!

Facial Development

Seventy-five percent of 12-year-olds need orthodontic treatment. Yet 90% of a child's face has already developed! By guiding facial development earlier, through the use of functional appliances, 80% of the treatment can be corrected before the adult teeth are present!

Cooperation

Younger children between the ages of 8 and 11 are often much more cooperative than children of 12 to 14.

Shorter Treatment Time

Another advantage of early Phase One treatment is that children will need to wear fixed braces on their adult teeth for less time.

To Correct Underdeveloped Jaws

Almost 50% of children who need orthodontic treatment due to a bad bite have underdeveloped lower jaws. Functional appliances can reposition the lower jaw forward, improve the child's profile and correct the bite problem - within 7 to 9 months! See what a difference functional appliances made to this young girl's profile!
